Modified ordering of the HCP-MMP atlas

The atlas used to define brain regions was the HCP-MMP surface-based atlas (Glasser et al. 2016), illustrated in Figs. S1. In the HCP-MMP atlas, each region has its RegionID, which we show in Table S1. Detailed information about the regions is available in the Supplementary Material File NIHMS68870-supplement-Neuroanatomical_Supplementary_Results.pdf provided by Glasser et al (2016). In that Supplementary Material file, a grouping of the regions is suggested based on geographic proximity and functional similarities, and this grouping is shown in the column labelled CortexID in Table S1. That has led to a different ordering of the regions, which we show in Table S1, with the original regionIDs from the HCP atlas shown in the column headed 'regionID'. This reordered version of the HCP-MMP atlas is described by Dr Dianne Patterson of the University of Arizona at <https://neuroimaging-core-docs.readthedocs.io/en/latest/pages/atlases.html>, where the following supporting files used to help generate Table S1 are available: HCP-MMP_UniqueRegionList.csv and Glasser_2016_Table.xlsx. We made file HCPMMP_CortexID_Ordering.xlsx from this, and this is available with the HCex (Huang, Rolls, Feng and Lin 2022). The connectivity matrices shown in the present paper used the ordering shown in Table S1, which is also used in the volumetric and extended form of this atlas, HCPex (Huang, Rolls, Feng and Lin 2022).

Table S1. Regions defined in the modified Human Connectome Project atlas (Glasser et al. 2016). L=left hemisphere, R=right. The column ‘Reordered region ID’ is that used in Figs. 4-7, and is a reordering of that based on suggestions in the Supplementary Information of Glasser et al (2016). In that Supplementary Information of that paper, the 360 regions are grouped and ordered based on geographic proximity and functional similarities as shown in column ‘Original ID. The regions were reordered and reorganized by Dr Dianne Patterson of the University of Arizona at and <https://neuroimaging-core-docs.readthedocs.io/en/latest/pages/atlases.html> with the [HCP-MMP_UniqueRegionList.csv](#), and are shown in the column labelled CortexID in Table S1 which is the order used in HCPex atlas (Huang, Rolls, Feng and Lin 2022) and in this paper. The volumes are in mm³. This modified HCPex atlas with the reordering is described elsewhere (Huang, Rolls, Feng and Lin 2022). All the analyses described in this paper were performed for the surface-based HCP-MMP registration..

Reordered ID (L, R)	Region	RegionLongName	Cortical Division	Cortex ID	Original ID	Voxel numbers (1mm ³) (L,R)

Column 1 (Reordered ID) shows the order in HCPex based on the HCP-MMP1_UniqueRegionList.csv, as described in the Methods, of the 360 cortical regions originally defined by Glasser et al (2016). The names of the cortical divisions shown in column 4 come from the same .csv file. The sixth column shows the original order used by Glasser et al (2016). Abbreviations: L=left hemisphere, R=right. MT+_Complex, MT+_Complex_and_Neighboring_Visual_Areas; SomaSens_Motor, Somatosensory_and_Motor; ParaCentral_MidCing, Paracentral_Lobular_and_Mid_Cingulate; Insula_FrontalOperc, Insular_and_Frontal_Opercular; TPO, Temporo-Parieto-Occipital_Junction; AntCing_MedPFC, Anterior_Cingulate_and_Medial_Prefrontal; OrbPolaFrontal, Orbital_and_Polar_Frontal.

HCP-MMP human brain parcellation: lateral view

Inferior view

HCP-MMP human brain parcellation: medial view

Fig. S1. Parcellation of the human cortex in the HCP-MMP atlas (Glasser, et al., 2016), and in its extended version HCPex (Huang, et al., 2022). The regions are shown on images of the human brain in inflated form with the sulci expanded sufficiently to allow the regions within the sulci to be shown. The abbreviations for each cortical region are provided in Table S1.

A 0-back faces > mean of four 0-back stimuli

B 0-back places > mean of four 0-back stimuli

C 0-back body parts > mean of four 0-back stimuli

D 0-back tools > mean of four 0-back stimuli

Fig. S2A. Brain regions in the right hemisphere exhibiting significant differences in the average BOLD signal for the four 0-back working memory conditions compared to the mean of these conditions, after Bonferroni correction ($\alpha=0.05$). Panels (A) and (C) show the top 30% of cortical regions with significant differences for the 0-back faces and 0-back body parts conditions contrasted with the mean of the four conditions, respectively. Panels (B) and (D) display all the brain regions with significant differences for the 0-back places and 0-back tools conditions compared to the mean of these four conditions, respectively.

A 0-back faces > mean of four 0-back stimuli

B 0-back places > mean of four 0-back stimuli

C 0-back body parts > mean of four 0-back stimuli

D 0-back tools > mean of four 0-back stimuli

Fig. S2B. Brain regions in the right hemisphere exhibiting significant differences in the average BOLD signal for the four 0-back working memory conditions compared to the mean of these conditions, after Bonferroni correction ($\alpha=0.05$). This is the same as Fig. S2A, except that all significant activations are included in (A) and (C). (SelectiveActivationsAllRight_label.eps)

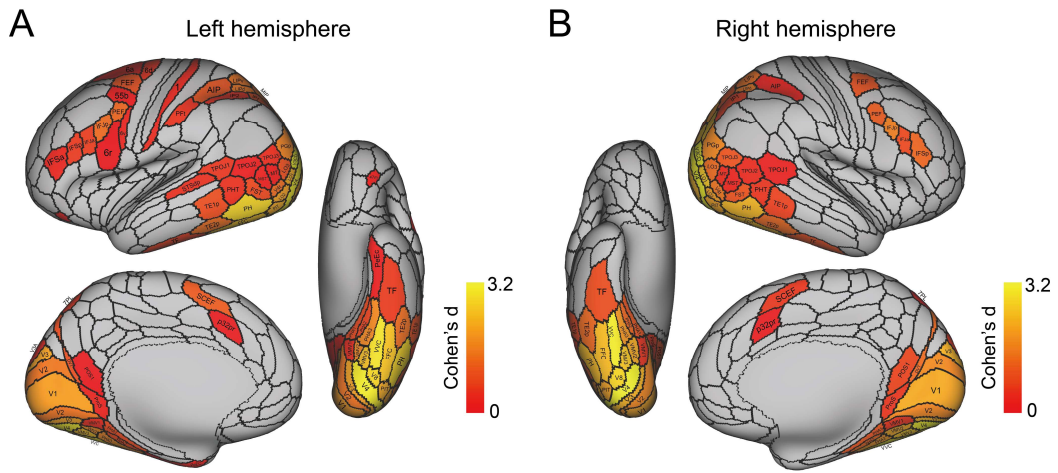

Fig. S3A. The top 50% of cortical regions exhibiting significant differences in the average BOLD signal between the initial 15 timepoints and the last 20 timepoints (when the BOLD signal response to the visual stimuli was occurring) of the mean across four 0-back working memory conditions after Bonferroni correction ($\alpha=0.05$). Panels (A) and (B) depict brain regions with significant differences in the left and right hemispheres, respectively. The effect size as indicated by Cohen's d is shown.

Fig. S3B. The timecourse of the BOLD signal in runs of the 0-back task for different cortical regions and averaged across the four stimulus types of faces, places, body parts, and tools. The cue for the start of a run starts in timebin 1, and the first visual stimulus in the run starts after 2.5 s at timebin 4. (selected_regions_timecourse.eps)

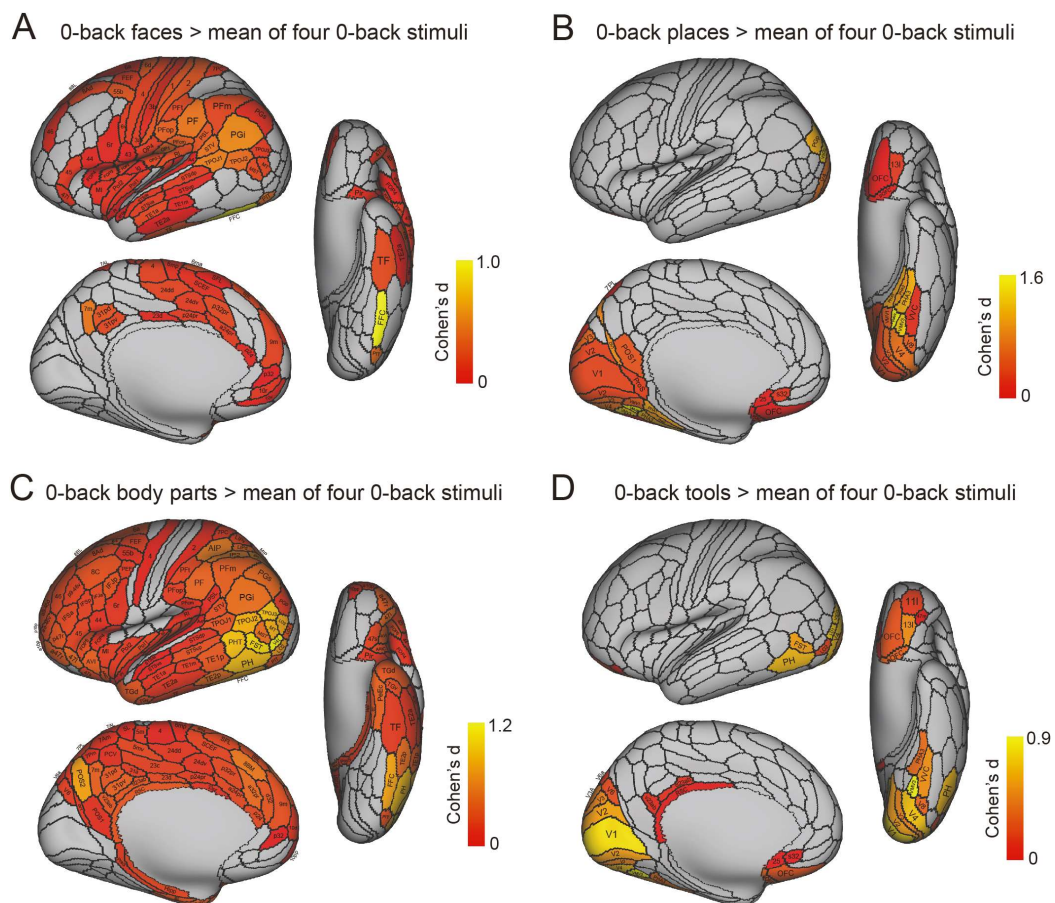

Fig. S3C. Brain regions in the left hemisphere with significant differences in the average BOLD signal for the faces, scenes, body parts, and tools compared to the mean of these conditions in the 0-back working memory task, after Bonferroni correction ($\alpha=0.05$). This is similar to Fig. 2 of the paper, except that all regions that passed Bonferroni correction are included in (A) and (C). (Fig.S3C.eps)

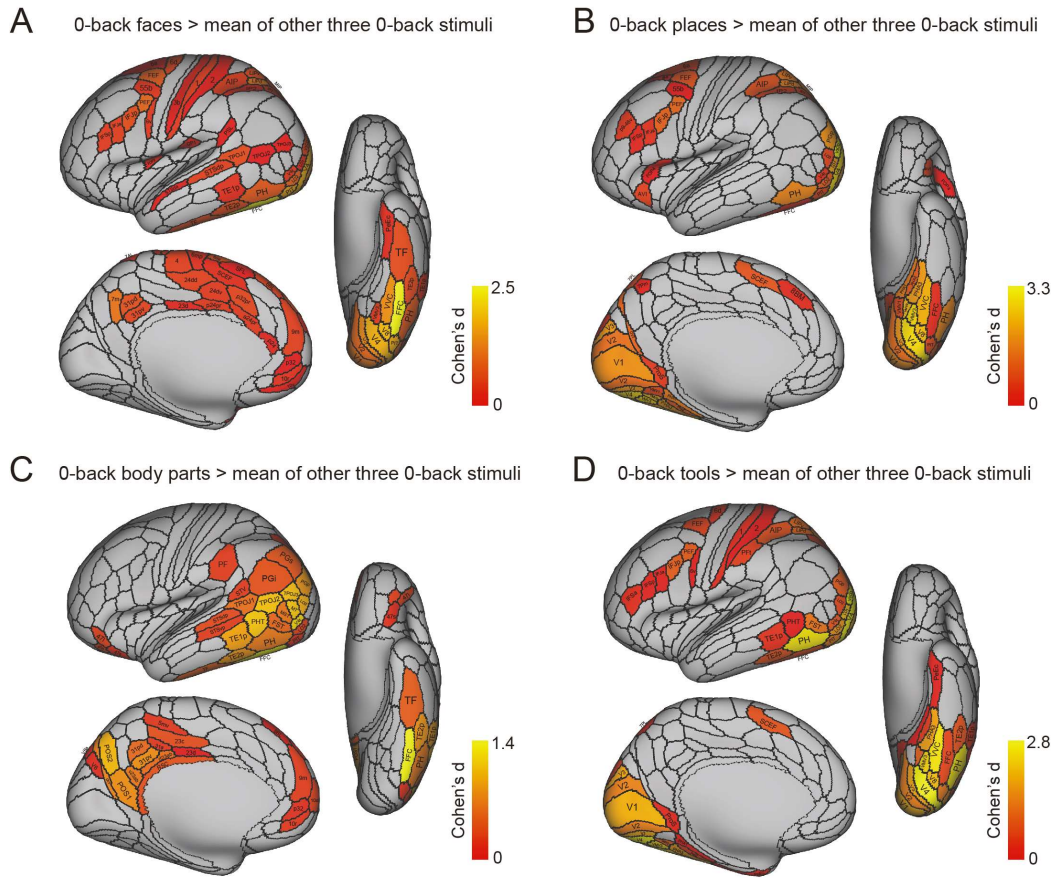

Fig. S3D. Brain regions in the left hemisphere with significant differences in the BOLD signal for the faces, scenes, body parts, and tools compared to the mean of the other three conditions in the 0-back working memory task, after Bonferroni correction ($\alpha=0.05$). (Fig.S3D.ai)

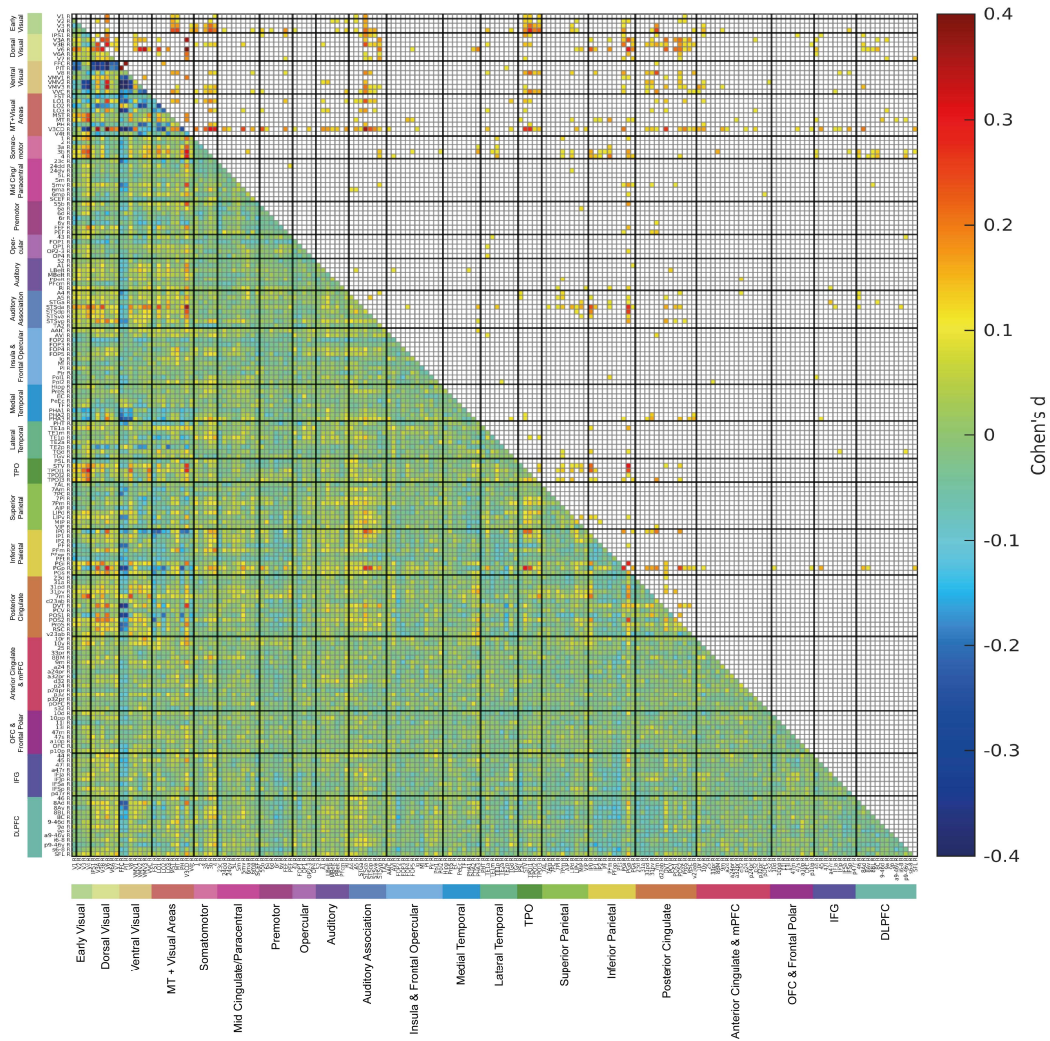

Fig. S4. The lower left triangle shows the matrix of functional connectivity differences between 0-back faces and the mean of all 0-back conditions processing in Working memory with the Cohen's d values showing the effect size of the differences. The matrix is for the functional connectivities in the *Right* hemisphere, as listed in Table S1, with V1, V2, V3 ... at the top of the y axis and the left of the x axis. The upper triangle matrix shows the Cohen's d values of positively significant links after FDR correction ($\alpha=0.05$). These results were from 956 participants in the HCP dataset. All the values shown in the matrix were limited to the range from -0.4 to 0.4. The covariates regressed out in this analysis were sex, age, drinker status, smoking status, education qualification and head motion.

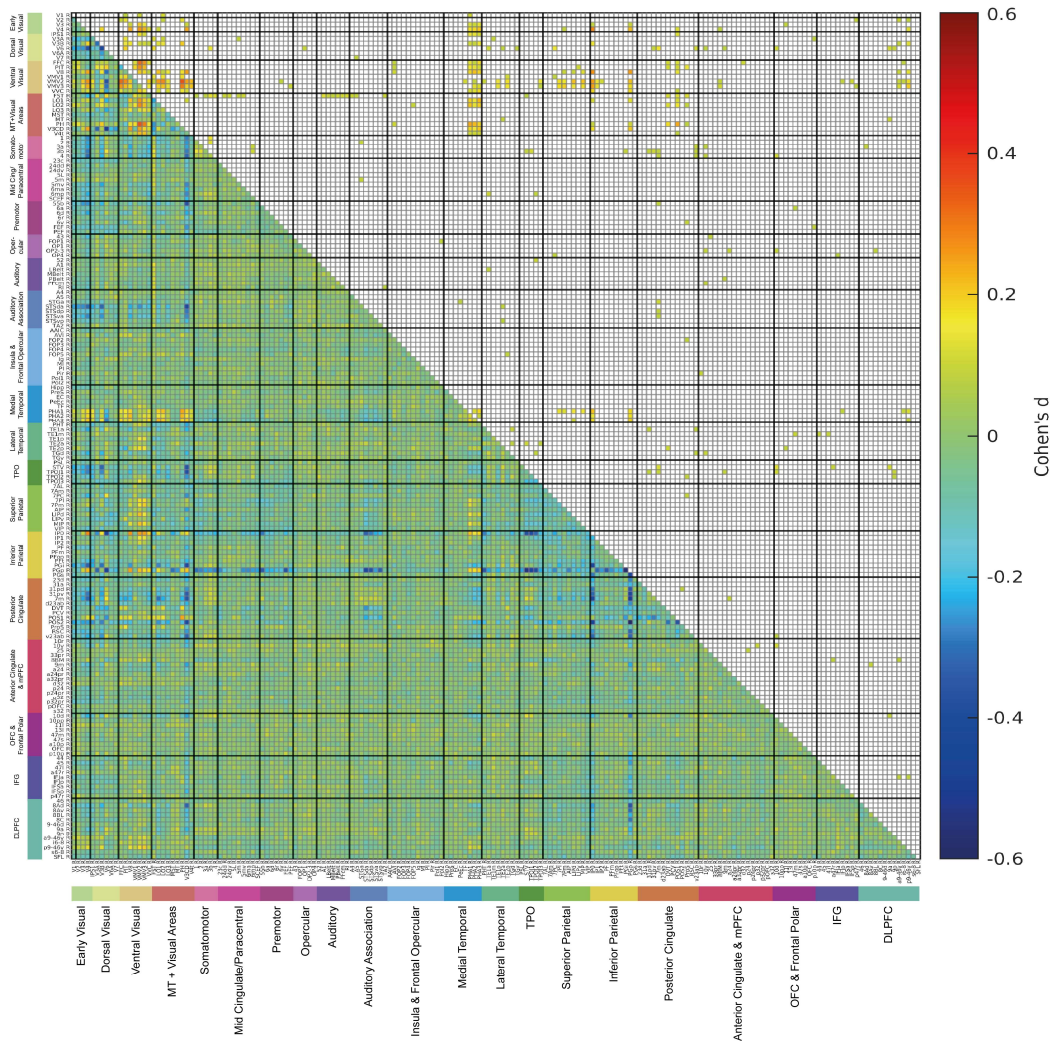

Fig. S5. The lower left triangle shows the matrix of functional connectivity differences between 0-back places (in fact scenes) and the mean of all 0-back conditions processing in Working memory with the Cohen's d values showing the effect size of the differences. The matrix is for the functional connectivities in the *Right* hemisphere, as listed in Table S1, with V1, V2, V3 ... at the top of the y axis and the left of the x axis. The upper triangle matrix shows the Cohen's d values of positively significant links after FDR correction ($\alpha=0.05$). These results were from 956 participants in the HCP dataset. All the values shown in the matrix were limited to the range from -0.6 to 0.6. The covariates regressed out in this analysis were sex, age, drinker status, smoking status, education qualification and head motion.

Fig. S6. The lower left triangle shows the matrix of functional connectivity differences between 0-back body parts and the mean of all 0-back conditions processing in Working memory with the Cohen's d values showing the effect size of the differences. The matrix is for the functional connectivities in the *Right* hemisphere, as listed in Table S1, with V1, V2, V3 ... at the top of the y axis and the left of the x axis. The upper triangle matrix shows the Cohen's d values of positively significant links after FDR correction ($\alpha=0.05$). These results were from 956 participants in the HCP dataset. All the values shown in the matrix were limited to the range from -0.5 to 0.5. The covariates regressed out in this analysis were sex, age, drinker status, smoking status, education qualification and head motion.

Fig. S7. The lower left triangle shows the matrix of functional connectivity differences between 0-back tools and the mean of all 0-back conditions processing in Working memory with the Cohen's d values showing the effect size of the differences. The matrix is for the functional connectivities in the *Right* hemisphere, as listed in Table S1, with V1, V2, V3 ... at the top of the y axis and the left of the x axis. The upper triangle matrix shows the Cohen's d values of positively significant links after FDR correction ($\alpha=0.05$). These results were from 956 participants in the HCP dataset. All the values shown in the matrix were limited to the range from -0.4 to 0.4. The covariates regressed out in this analysis were sex, age, drinker status, smoking status, education qualification and head motion.

Fig. S8 The lower left triangle shows the matrix of functional connectivity differences between the initial 15 timepoints and the last 20 timepoints (when the BOLD signal was responding to the visual stimuli) of the mean across four 0-back working memory conditions and with the Cohen's d values showing the effect size of the differences. The matrix is for the functional connectivities in the *Left* hemisphere, as listed in Table S1, with V1, V2, V3 ... at the top of the y axis and the left of the x axis. The upper triangle matrix shows the Cohen's d values of positively significant links after Bonferroni correction ($\alpha=0.001$). These results were from 956 participants in the HCP dataset. All the values shown in the matrix were limited to the range from -0.6 to 0.6. The covariates regressed out in this analysis were sex, age, drinker status, smoking status, education qualification and head motion.

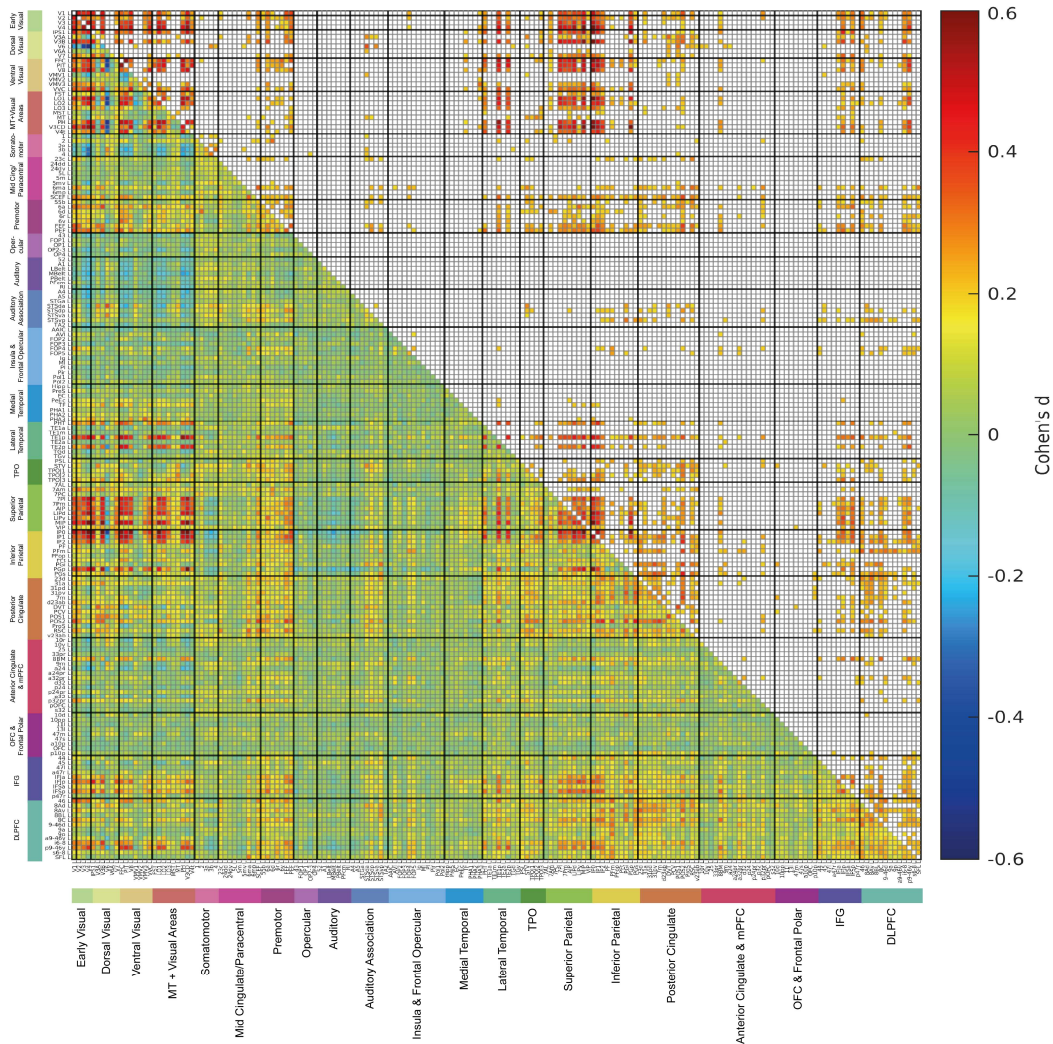

Fig. S9 The lower left triangle shows the matrix of functional connectivity differences between the initial 15 timepoints and the last 20 timepoints (when the BOLD signal was responding to the visual stimuli) of the mean across four 0-back working memory conditions with the Cohen's d values showing the effect size of the differences. The matrix is for the functional connectivities in the *Right* hemisphere, as listed in Table S1, with V1, V2, V3 ... at the top of the y axis and the left of the x axis. The upper triangle matrix shows the Cohen's d values of positively significant links after Bonferroni correction ($\alpha=0.001$). These results were from 956 participants in the HCP dataset. All the values shown in the matrix were limited to the range from -0.6 to 0.6. The covariates regressed out in this analysis were sex, age, drinker status, smoking status, education qualification and head motion.

Table S2 The top 20 significant regions in the left hemisphere that were more positively activated by each of the four stimulus types (faces, paces, body parts, and tools) contrasted with the mean of the four stimulus types after Bonferroni correction ($\alpha=0.05$) in the 0-back condition. All p values are significant after Bonferroni correction apart from those shown in red font. The covariates stated in the text were removed from these analyses. These conventions apply to all the following Tables.

0-back faces vs. mean of the four 0-back stimuli			0-back places vs. mean of the four 0-back stimuli
